## FOP Recap #10

#### **Java Generics**

## Guten Tag!

Generics Basiskonzept
Instanziierung
Nutzen von Typparameter
Bennenung von Typparameter
Mehrere Typparameter

Diamond operator

Generische Methoder

Statische generische Methoder

Fingeschränkte Typparameter

## Generics!

"Generics — You think you understand it, and then you don't..."

```
public class StringHolder {
   public String value;
}

public class IntegerHolder {
   public Integer value;
}
```

```
public class Holder<T> {
    public T value;
}
```

```
public class StringHolder {
   public String value;
}

public class IntegerHolder {
   public Integer value;
}
```

```
public class Holder<T> {
    public T value;
}
```

#### Vorteile von Generics

Lösung mit Generics kürzer

```
public class StringHolder {
   public String value;
}

public class IntegerHolder {
   public Integer value;
}
```

```
public class Holder<T> {
   public T value;
}
```

#### Vorteile von Generics

- Lösung mit Generics kürzer
- Vermeidet Redundanz ⇒ Fehler vermeiden, Wartbarkeit verbessern

Instanziierung

```
public class Holder<T> {
    public T value;
}
```

Instanziierung

```
public class Holder<T> {
    public T value;
}
```

1

Holder<Integer> integerHolder = new Holder<Integer>();
Holder<Boolean> booleanHolder = new Holder<Boolean>();

**Nutzen von Typparameter** 

```
public class Holder<T> {
    public T value;
    public T getValue() {
        return value;
    public void killItWithFire() {
        value = null;
```

**Bennenung von Typparameter** 

- Ein Großbuchstabe
- T für Type
- K für Key
- V für Value
- E für Element
- ....

Mehrere Typparameter

```
</>>
                               </>>
                                          </>>
                                                                            </>>
          ohne Generics
                                                      mit Generics
public class
                                          public class Pair<A, B> {
    StringAndDoubleHolder {
                                              public A valueA;
    public String valueA:
                                              public B valueB:
    public Double valueB;
public class
    IntegerAndShortHolder {
    public Integer valueA:
    public Short valueB;
```

Generics Basiskonzept

### Diamond operator

Generische Methoden

Statische generische Methoden

Eingeschränkte Typparameter

## **Diamond operator**

ArrayList<String> myList1 = new ArrayList<String>();
ArrayList<String> myList2 = new ArrayList<>(); // String wird impliziert

List<String> mvList3 = new Arravlist<>():

Erben von generischen Klassen

? Wildcards

```
public <T> void printList(List<T> list) {
   for (T item : list) {
      System.out.println(item);
   }
}
```

? Wildcards

```
public <T> void printList(List<T> list) {
    for (T item : list) {
        System.out.println(item);
    }
}

public void printList(List<?> list) {
```

```
public void printList(List<?> list) {
    for (Object item : list) {
        System.out.println(item);
    }
}
```

? Wildcards

```
public <T extends Number> void printList(List<T> list) {
    for (T item : list) {
        System.out.println(item.intValue() + 1);
    }
}
```

? Wildcards

```
public <T extends Number> void printList(List<T> list) {
    for (T item : list) {
        System.out.println(item.intValue() + 1);
    }
}

public void printList(List<? extends Number> list) {
    for (Number item : list) {
```

System.out.println(item.intValue() + 1):

```
1
2
3
```

```
public void nonGenMethod(Holder<? extends Number> a, Holder<?> b) {
    // ...
}
```

Wann werden wildcards verwendet?

```
public void nonGenMethod(Holder<? extends Number> a, Holder<?> b) {
    // ...
}

public <T extends Number> void genMethodA(Holder<T> a, Holder<T> b) {
    // ...
```

Wann werden wildcards verwendet?

```
public void nonGenMethod(Holder<? extends Number> a, Holder<?> b) {
   // ...
public <T extends Number> void genMethodA(Holder<T> a. Holder<T> b) {
   // ...
public <T extends Number, Q> void genMethodB(Holder<T> a, Holder<Q> b) {
   // ...
```

```
public void nonGenMethod(Predicate<? super Number> a) {
    a.intValue(); // !! Nicht erlaubt
```

? Wildcards mit super

```
public void nonGenMethod(Predicate<? super Number> a) {
    a.intValue(); // !! Nicht erlaubt
}

Predicate<? super Number> a = (Object x) -> true;
Predicate<? super Number> b = (Serializable x) -> true;
Predicate<? super Number> c = (Number x) -> true;
```

#### Generic Variance

- ? extends T Covariance (Lesender Zugriff)
- ? super T Contravariance (Schreibender Zugriff)
- T Invariance (Beides)

public class A {}
public class B extends A {}

# Generic Variance Covariance - Parameters

1 2 public class A {}
public class B extends A {}

1

public void foo(A a) { ... }

# Generic Variance Covariance - Parameters

```
public class A {}
public class B extends A {}
```

public void foo(A a) { ... }

```
foo(new A());
foo(new B()); // parameter covariance
```

public class A {}
public class B extends A {}

**Covariance - Return type** 

public class A {}

```
public class B extends A {}

public class Baz {
    public A foo() {...}
}

public class SpecialBaz extends Baz {
    @Override
    public B foo() {...} // return type covariance
}
```

**Covariance - Arrays** 

public class A {}
public class B extends A {}

```
public class A {}
public class B extends A {}
```

```
A[] myArray = new B[2]; // array covariance
```

```
public class A {}
public class B extends A {}
```

```
1 A[] myArray = new B[2]; // array covariance
```

```
A[] myArray = new A[2];
myArray[0] = new B(); // array covariance
```

```
public class A {}
public class B extends A {}
public class C extends A {}
```

```
public class A {}
public class B extends A {}
public class C extends A {}
```

```
A[] myArray = new B[2];
myArray[0] = new B();
```

**Covariance - Arrays** 

```
public class A {}
public class B extends A {}
public class C extends A {}

A[] myArray = new B[2];
myArray[0] = new B();

A[] myArray = new B[2];
```

myArray[0] = new C(); // !! array covariance

2

public class A {}
public class B extends A {}

Invariance

```
public class A {}
public class B extends A {}
```

```
List<B> myList = new ArrayList<B>();
List<A> otherList = myList; // !!

List<? extends A> list = myList;
```

public class A {}

Invariance

```
public class B extends A {}

List<B> myList = new ArrayList<B>();
List<A> otherList = myList; // !!

List<? extends A> list = myList;
List.add(new A()); // !! compile error
list.add(new B()); // !! compile error
```

Invariance

```
public void readFromList(List<? extends Number> list) {
    // z.B: List<Double>, List<Integer>, List<Number>
    Number a = list.get(0);
}

public void readFromList(List<? super Number> list) {
    // z.B: List<Number>, List<Object>
    Number a = list.get(0); // !!
}
```

Wann super, wann extends?

```
public void writeToList(List<? extends Number> list) {
    // z.B: List<Double>, List<Integer>, List<Number>
    list.add(Double.valueOf(2.0)); // !!
}

public void readFromList(List<? super Number> list) {
    // z.B: List<Number>, List<Object>
    list.add(Double.valueOf(2.0));
}
```

Wann super, wann extends?

```
public void both(List<? extends Number> list) {
    // z.B: List<Double>,List<Integer>,List<Number>
    Number a = list.get(0):
    list.add(Double.valueOf(2.0)): // !!
public void readFromList(List<? super Number> list) {
    // z.B: List<Number>.List<Object>
    Number a = list.get(0): // !!
    list.add(Double.valueOf(2.0)):
```

Wann super, wann extends?

```
public void both(List<Double> list) {
   // nur List<Double>
   Number a = list.get(0);
   list.add(Double.valueOf(2.0));
}
```
